semantic media for DMP meeting

mark.sandler@qmul.ac.uk
queen mary university of london
semantic media

- convergence of semantic web (ontologies, RDF), content analysis, linked data, logic, inference

- preferably (initial) content analysis is at source

- this enables intelligent journeys through media collections, beyond recommendation, and journeys within media
three examples

• sonicvisualiser.org: creates linkable metadata when analysing audio, and can import it too, and lots more

• catfishsmooth.net: a demonstration of browsing through the world of music

• BBC’s mythology engine - http://www.bbc.co.uk/blogs/researchanddevelopment/2010/03/the-mythology-engine-represent.shtml: watch the video and follow the links to see what the BBC has already done in the world of linked data mixed with compelling narrative
